Mr. E Collado
CTE Coordinator

Barry Roopnarine
Auto Body Instructor

11TH Grade Students

This is an onsite assignment, if you are unable to complete this alone you must have a parent or guardian go with you. This is not a group project and must be completed alone.

Visit a collision repair shop. Observe the process for repairing damage using body filler. Take pictures- yourself must be included in the pictures.

Interview the technician to find out what is being done. Some questions that should be answered in details are:

1. Why is filler being used?
2. How did you mix and prepare the filler?
3. How did you prepare the surface for filler?
4. Once the filler is applied what is the next course of action?
5. What grits sandpaper are used to sand the filler?
6. How do you know when the surface is straight?
7. Does anything go on after the filler is sanded to repair pinholes and other imperfections?
8. What grit is final sanding done with before priming?
9. What type of primer is applied over the filler?
10. What is the process for sanding the primer including grit sandpaper to use?

Create a short video of this process being done. You must be in the video so create an introduction while present at the shop.

For each question above include a picture to go with the answer. Create a presentation of the entire visit with each slide being a picture followed by a detailed description of what is being done. **Each question should be it's own slide. Include video in presentation.**

Upload presentation to GoogleDrive then share with me. Must be done before the first day of class. This is a required project and must be done.
